

Testing Beamer in Org

Eric S Fraga

March 20, 2013

Outline

The first topic

Nested blocks

Use distillation for separation of two components.

Nested blocks

Use distillation for separation of two components.

Example (Model)

$$y = \frac{\alpha x}{1 + (\alpha - 1)x}$$

Nested blocks

Use distillation for separation of two components.

Example (Model)

$$y = \frac{\alpha x}{1 + (\alpha - 1)x}$$

Goal

Minimise energy
consumption

Nested blocks

Use distillation for separation of two components.

Example (Model)

$$y = \frac{\alpha X}{1 + (\alpha - 1)x}$$

Goal

Minimise energy consumption

Definition (Distillation)

Nested blocks

Use distillation for separation of two components.

Example (Model)

$$y = \frac{\alpha X}{1 + (\alpha - 1)x}$$

Goal

Minimise energy consumption

Approach

We can change both the number of trays and the reflux rate.

Definition (Distillation)
